Australian Wildlife Services Cybertracker Capability

Australian Wildlife Services is a wildlife management and environmental consultancy based in Canberra. AWS is led by Dr George Wilson who has more than 35 years experience in wildlife management, aerial survey, tourism, Indigenous land management, strategic policy analysis, and research program management. Australian Wildlife Services provides ongoing scientific and project management support to several Indigenous ranger groups across Australia.

Jennifer Smits, Research Officer, AWS, has the experience to provide Cybertracker sequence development and training. She is well versed in Cybertracker software development, data collection, export and Query analysis, and utilising data through mapping programs such as Google Earth and ArcGIS and has experience training Indigenous participants to use the software and GPS devices.

Jennifer has worked with Indigenous Rangers for two and half years delivering a wide range of environmental monitoring training and support. During this period, she has refined and developed **Cybertracker** sequences, for (and with) Aboriginal ranger groups in Central Australia, Western Australia and Cape York. She has provided on the ground and classroom Cybertracker use training to these groups. Recently she developed a Cybertracker sequence for cultural artefact and art surveys for Anangu rangers in Central Australia. She is currently developing a Cybertracker sequence for implementation of Landscape Function Analysis, a landscape assessment tool.

She has well-developed computer mapping and GIS skills using ArcGIS, Manifold and MapInfo. She is experienced in use of the Getac and Nomad GPS devices and Windows Mobile devices for Cybertracker.

Below are some examples of AWS' Cybertracker capabilities and training and some maps produced by Cybertracker data collection.
